

Package: deflateBR (via r-universe)

September 4, 2024

Type Package

Title Deflate Nominal Brazilian Reais

Version 1.1.2

Description Simple functions to deflate nominal Brazilian Reais using several popular price indexes downloaded from the Brazilian Institute for Applied Economic Research.

`deflate`*Deflate Nominal Brazilian Reais Using Various Price Indexes*

Description

`deflate()` uses data from the Brazilian Institute for Applied Economic Research's API (IPEA-DATA) to adjust nominal Brazilian Reais for inflation.

Usage

```
deflate(nominal_values, nominal_dates, real_date, index = c("ipca",  
  "igpm", "igpdi", "ipc", "inpc"))
```

Arguments

`nominal_values` A numeric vector containing nominal Brazilian Reais to deflate.

`nominal_dates` A Date vector with corresponding nominal dates (i.e., when nominal values were measured). Values are set to the previous month, following the standard methodology used by the [Brazilian Central Bank](#).

`real_date` A value indicating the reference date to deflate nominal values in the format 'MM/YYYY' (e.g., '01/2018' for January 2018).

`index` Indicates the price index used to deflate nominal Reais. Valid options are: `ipca`, `igpm`, `igpdi`, `ipc`, and `inpc`.

Details

Each one of the five price indexes included in the function are maintained by two Brazilian agencies: IPCA and INPC indexes are maintained by Brazilian Institute of Geography and Statistics (IBGE); IGP-M, IGP-DI, and IPC are maintained by Getulio Vargas Foundation (FGV). For an overview of the indexes' methodologies and covered periods, check the Brazilian Central Bank official [FAQ](#).

Value

A numeric vector.

References

For more information on the Brazilian Institute for Applied Economic Research's API, please check (in Portuguese): <http://www.ipeadata.gov.br/>.

Examples

```
## Not run:  
# Use IPCA index to deflate a vector of nominal Brazilian Reais  
reais <- rep(100, 5)  
actual_dates <- seq.Date(from = as.Date("2001-01-01"), to = as.Date("2001-05-01"), by = "month")
```

```
deflate(reais, actual_dates, "01/2018", "ipca")

# Using IGP-M index
deflate(reais, actual_dates, "01/2018", "igpm")

## End(Not run)
```

igpdi

Deflate Nominal Brazilian Reais Using IGP-DI

Description

`ipc()` is a convenience function to deflate nominal Brazilian Reais using the Getulio Vargas Foundation's IGP-DI price index.

Usage

```
igpdi(nominal_values, nominal_dates, real_date)
```

Arguments

`nominal_values` A numeric vector containing nominal Brazilian Reais to deflate.

`nominal_dates` A Date vector with corresponding nominal dates (i.e., when nominal values were measured). Values are set to the previous month, following the standard methodology used by the [Brazilian Central Bank](#).

`real_date` A value indicating the reference date to deflate nominal values in the format 'MM/YYYY' (e.g., '01/2018' for January 2018).

Value

A numeric vector.

See Also

[deflate](#).

Examples

```
## Not run:
# Use IGP-DI index to deflate a vector of nominal Brazilian Reais
reais <- rep(100, 5)
actual_dates <- seq.Date(from = as.Date("2001-01-01"), to = as.Date("2001-05-01"), by = "month")

igpdi(reais, actual_dates, "01/2018")

## End(Not run)
```

`igpm`*Deflate Nominal Brazilian Reais Using IGP-M*

Description

`igpm()` is a convenience function to deflate nominal Brazilian Reais using the Getulio Vargas Foundation's IGP-M price index.

Usage

```
igpm(nominal_values, nominal_dates, real_date)
```

Arguments

`nominal_values` A numeric vector containing nominal Brazilian Reais to deflate.

`nominal_dates` A Date vector with corresponding nominal dates (i.e., when nominal values were measured). Values are set to the previous month, following the standard methodology used by the [Brazilian Central Bank](#).

`real_date` A value indicating the reference date to deflate nominal values in the format 'MM/YYYY' (e.g., '01/2018' for January 2018).

Value

A numeric vector.

See Also

[deflate](#).

Examples

```
## Not run:  
# Use IGP-M index to deflate a vector of nominal Brazilian Reais  
reais <- rep(100, 5)  
actual_dates <- seq.Date(from = as.Date("2001-01-01"), to = as.Date("2001-05-01"), by = "month")  
  
igpm(reais, actual_dates, "01/2018")  
  
## End(Not run)
```

`inflation`*Calculate Inflation Between Two Dates*

Description

`inflation()` is a convenience function used to calculate the inflation rate between two periods

Usage

```
inflation(initial_date, end_date, index = c("ipca", "inpc", "igpm",
      "igpdi", "ipc"))
```

Arguments

<code>initial_date</code>	Initial date in the 'MM/YYYY' format (character).
<code>end_date</code>	End date in the 'MM/YYYY' format (character).
<code>index</code>	One of the following options: <code>ipca</code> , <code>inpc</code> , <code>igpm</code> , <code>igpdi</code> , and <code>ipc</code> . Each one of these options uses the following price indexes, respectively: IPCA and INPC indexes maintained by Brazilian Institute of Geography and Statistics (IBGE); and IGP-M, IGP-DI, and IPC maintained by Getulio Vargas Foundation (FGV). For an overview of the indexes' methodologies and covered periods, check the Brazilian Central Bank official FAQ .

Value

The inflation rate, in percent, between `initial_date` and `end_date`.

See Also

[deflate](#).

Examples

```
## Not run:
# Inflation rate between January 2010 to January 2018 calculated using IPCA price index
inflation("01/2010", "01/2018", "ipca")

# Inflation rate between January 2014 to December 2014 calculated using IGP-M price index
inflation("01/2014", "12/2014", "igpm")

## End(Not run)
```

inpc

Deflate Nominal Brazilian Reais Using INPC

Description

`inpc()` is a convenience function to deflate nominal Brazilian Reais using the Brazilian Institute of Geography and Statistics' INPC price index.

Usage

```
inpc(nominal_values, nominal_dates, real_date)
```

Arguments

`nominal_values` A numeric vector containing nominal Brazilian Reais to deflate.

`nominal_dates` A Date vector with corresponding nominal dates (i.e., when nominal values were measured). Values are set to the previous month, following the standard methodology used by the [Brazilian Central Bank](#).

`real_date` A value indicating the reference date to deflate nominal values in the format 'MM/YYYY' (e.g., '01/2018' for January 2018).

Value

A numeric vector.

See Also

[deflate](#).

Examples

```
## Not run:  
# Use INPC index to deflate a vector of nominal Brazilian Reais  
reais <- rep(100, 5)  
actual_dates <- seq.Date(from = as.Date("2001-01-01"), to = as.Date("2001-05-01"), by = "month")  
  
inpc(reais, actual_dates, "01/2018")  
  
## End(Not run)
```

`ipc`*Deflate Nominal Brazilian Reais Using IPC*

Description

`ipc()` is a convenience function to deflate nominal Brazilian Reais using the Getulio Vargas Foundation's IPC price index.

Usage

```
ipc(nominal_values, nominal_dates, real_date)
```

Arguments

`nominal_values` A numeric vector containing nominal Brazilian Reais to deflate.

`nominal_dates` A Date vector with corresponding nominal dates (i.e., when nominal values were measured). Values are set to the previous month, following the standard methodology used by the [Brazilian Central Bank](#).

`real_date` A value indicating the reference date to deflate nominal values in the format 'MM/YYYY' (e.g., '01/2018' for January 2018).

Value

A numeric vector.

See Also

[deflate](#).

Examples

```
## Not run:  
# Use IPC index to deflate a vector of nominal Brazilian Reais  
reais <- rep(100, 5)  
actual_dates <- seq.Date(from = as.Date("2001-01-01"), to = as.Date("2001-05-01"), by = "month")  
  
ipc(reais, actual_dates, "01/2018")  
  
## End(Not run)
```

`ipca`*Deflate Nominal Brazilian Reais Using IPCA*

Description

`ipca()` is a convenience function to deflate nominal Brazilian Reais using the Brazilian Institute of Geography and Statistics' IPCA price index.

Usage

```
ipca(nominal_values, nominal_dates, real_date)
```

Arguments

`nominal_values` A numeric vector containing nominal Brazilian Reais to deflate.

`nominal_dates` A Date vector with corresponding nominal dates (i.e., when nominal values were measured). Values are set to the previous month, following the standard methodology used by the [Brazilian Central Bank](#).

`real_date` A value indicating the reference date to deflate nominal values in the format 'MM/YYYY' (e.g., '01/2018' for January 2018).

Value

A numeric vector.

See Also

[deflate](#).

Examples

```
## Not run:  
# Use IPCA index to deflate a vector of nominal Brazilian Reais  
reais <- rep(100, 5)  
actual_dates <- seq.Date(from = as.Date("2001-01-01"), to = as.Date("2001-05-01"), by = "month")  
  
ipca(reais, actual_dates, "01/2018")  
  
## End(Not run)
```
